On Monday, March 28, 1994, I received a call from Jerry North of Interstate Brick. He called to update me on their mining activities.

The work on Phase I of the new pit has provided more topsoil than expected, and it looks like two different grades. Jerry has stockpiled the topsoil grades separately adjacent to the Phase I pit. Their drilling results have caused them to shift the location of the Phase I pit to the southeast slightly. The clay vein dropped more than anticipated. Their drilling intercepted an old adit about 110 feet down. Now they know for certain where one of the underground workings is. They want to stockpile this clay at one of the old pits located north of the two existing clay stockpiles. I told him we had allowed for up to five acres of minor adjustments in their plan. Also, they have placed the overburden from the Phase I pit in the area near the earth/rock dam. This location will allow them to immediately push this material as backfill into the Phase I pit area. Jerry is working on a response to the last Division letter.

A COPY OF THIS UPDATE HAS BEEN SENT TO THE FILE.
